

▼ Example of Linear Regression with Two Input Variables using the Iris Flower Dataset

- We would like to predict "petal width" (column 4 in the original dataset) using sepal width (column 2) and petal length (column 3)
- Metadata: <https://github.com/badriadhikari/2019-Spring-AI/blob/master/supplementary/iris.names>

```
1 from keras.models import Sequential
2 from keras.layers import Dense
3 import numpy as np
4 import matplotlib.pyplot as plt
5
6 # Column 2. sepal width in cm (load as col 0)
7 # Column 3. petal length in cm (load as col 1)
8 # Column 4. petal width in cm (load as col 2)
9 datapath = "https://raw.githubusercontent.com/badriadhikari/2019-Spring-AI/"
10 datapath = datapath + "master/supplementary/iris.data"
11 dataset = np.genfromtxt(datapath, delimiter=",", usecols=(1, 2, 3))
12
13 print('')
14 print(dataset.shape)
15 print('')
16 print(dataset[0:5])
```

☞ Using TensorFlow backend.

```
(150, 3)
```

```
[[3.5 1.4 0.2]
 [3.  1.4 0.2]
 [3.2 1.3 0.2]
 [3.1 1.5 0.2]
 [3.6 1.4 0.2]]
```

```
1 # Q1. Why is shuffling important before splitting?
2 np.random.shuffle(dataset)
3 print('')
4 print(dataset[0:5])
5 train = dataset[:100]
6 valid = dataset[100:]
7 print('')
8 print(train.shape)
9 print('')
10 print(valid.shape)
```
